1. Project Title

AWS Static Website Hosting

2. Internship Details

Intern ID	CITS5437
Full Name	Sakshi Kohli
Organization	CODTECH
Domain	Cloud Computing
Duration	4 Weeks

3. Abstract

This project demonstrates the development and cloud deployment of a responsive static portfolio website using Amazon S3 Static Website Hosting. The website was developed using HTML5, CSS3, and JavaScript and contains intern information, technical skills, project details, and contact information.

After local testing, the website was uploaded to an Amazon S3 bucket while preserving the folder structure. Static Website Hosting was enabled, public access settings were configured, and a bucket policy was added. The final website was successfully deployed and tested using the S3 website endpoint.

4. Project Objectives

- Develop a professional responsive static portfolio website.
- Organize HTML, CSS, and JavaScript files using a proper folder structure.
- Create and configure an Amazon S3 bucket.
- Enable Amazon S3 Static Website Hosting.
- Configure public access and a bucket policy.
- Upload project files while preserving the folder structure.
- Test the deployed website using the S3 website endpoint.
- Maintain documentation and deployment screenshots.
- Use Git and GitHub for version control and submission.

5. Technologies and Tools Used

HTML5

Website structure and content.

CSS3

Professional styling and responsive layout.

JavaScript

Interactive functionality.

AWS

Cloud deployment platform.

Amazon S3

Website file storage and static hosting.

Git and GitHub

Version control, source storage, documentation, and submission.

GitHub Desktop

Committing and publishing project files.

Visual Studio Code

Editing HTML, CSS, JavaScript, Markdown, and text files.

6. AWS Deployment Configuration

Configuration	Details
AWS Service	Amazon S3
AWS Region	Europe (Stockholm)
Region Code	eu-north-1
Bucket Name	sakshi-codtech-static-website-2026
Hosting Type	Static Website Hosting
Index Document	index.html
Website Status	Successfully Deployed

7. Project Structure

```
AWS-Static-Website-Hosting/  
|-- index.html  
|-- README.md  
|-- STRUCTURE.txt  
|-- assets/  
| |-- css/style.css  
| |-- js/script.js  
| `-- images/  
|-- documentation/  
| |-- PROJECT_DOCUMENTATION.md  
| `-- VIVA_QUESTIONS.md  
`-- screenshots/  
|-- 01-s3-bucket-created.png  
|-- 02-static-website-hosting-enabled.png  
|-- 03-public-access-off.png  
|-- 04-bucket-policy-added.png  
|-- 05-project-files-uploaded.png
```

```
`-- 06-live-website-output.png
```

8. Website Implementation

The main entry point is **index.html**. The stylesheet is stored at **assets/css/style.css**, and JavaScript is stored at **assets/js/script.js**. The complete folder structure was preserved during the Amazon S3 upload so relative paths continued to work correctly.

CSS Link

```
<link rel="stylesheet" type="text/css" href="./assets/css/style.css">
```

JavaScript Link

```
<script src="./assets/js/script.js"></script>
```

9. Website Features

- Professional responsive design.
- Navigation bar.
- Home, About, Skills, Project, and Contact sections.
- Mobile-friendly layout.
- External CSS and JavaScript.
- Cloud deployment using Amazon S3.

10. AWS S3 Deployment Procedure

Step 1: Access AWS

Open the AWS Management Console and select Amazon S3.

Step 2: Create an S3 Bucket

Create sakshi-codtech-static-website-2026 in Europe (Stockholm), eu-north-1.

Step 3: Enable Static Website Hosting

Enable hosting in Properties and set index.html as the index document.

Step 4: Configure Public Access

Disable the required bucket-level Block Public Access setting for this public website project.

Step 5: Add Bucket Policy

Allow public read access to website objects using the s3:GetObject action.

Step 6: Upload Project Files

Upload index.html and the assets folder while preserving the original directory structure.

Step 7: Test the Website

Open the S3 website endpoint and verify HTML, CSS, and JavaScript load successfully.

11. Deployment Evidence

The GitHub repository contains six screenshots documenting the complete AWS deployment:

- 01-s3-bucket-created.png
- 02-static-website-hosting-enabled.png
- 03-public-access-off.png
- 04-bucket-policy-added.png
- 05-project-files-uploaded.png
- 06-live-website-output.png

These files provide evidence of bucket creation, hosting configuration, public access setup, bucket policy, uploaded files, and the live website output.

12. Actual Result

The project was successfully completed and deployed using Amazon S3 Static Website Hosting. The final website loads correctly in a browser, displays the complete responsive portfolio design, loads external CSS and JavaScript files, and is publicly accessible through the S3 website endpoint.

Live Website:

<http://sakshi-codtech-static-website-2026.s3-website.eu-north-1.amazonaws.com/>

13. Learning Outcomes

- Creating and configuring an S3 bucket.
- Enabling S3 Static Website Hosting.
- Understanding public access settings and bucket policies.
- Deploying HTML, CSS, and JavaScript files to the cloud.
- Preserving folder structure and relative paths.
- Testing a cloud-hosted website.
- Using GitHub Desktop for version control.
- Maintaining professional technical documentation.

14. Challenges Faced

- Linking the CSS file using the correct relative path.
- Preserving assets/css and assets/js folders.
- Configuring public access correctly.
- Adding the correct S3 bucket policy.
- Understanding the difference between an object URL and the static website endpoint.
- Organizing deployment screenshots with meaningful file names.

These challenges were resolved by verifying file paths, checking the bucket configuration, preserving the project structure, and testing the final website endpoint.

15. Security Considerations

- AWS access keys were not uploaded to GitHub.
- Secret access keys were not stored in project files.
- Passwords and private credentials were not committed to the repository.
- Only website files required for public access were stored in the public S3 bucket.
- Public access was configured only for this static website project bucket.

16. Conclusion

The AWS Static Website Hosting project was successfully completed. A responsive portfolio website was developed using HTML5, CSS3, and JavaScript and deployed using Amazon S3 Static Website Hosting.

The project provided practical experience with S3 bucket creation, public access configuration, bucket policies, static website hosting, cloud deployment, GitHub version control, and technical documentation.
